

Step-by-step instructions

Step 1 - Measure MAGfinity track Layout

Taking the MAGfinity track dimensions into consideration, measure and draw your desirable track line on the drywall surface.

Step 2 - Cut Into Drywall

Cut into drywall to create opening. Make sure the cut is precise and does not exceed 1/8" of a fixture size for a sharp looking installation.

Step 3 - Power & Wiring

Find the ideal placement for remote LED drivers either at the nearest utility room or the track power box. From there, run the wires to either end of your opening.

Step 4 - Attach Connector

Using WAGO connectors, attach 3 pin connectors to your power supply wires. Each power supply requires 110/277 VAC connection.

Step 5 - Track Placement

Join the flexible 2 pin connectors first and place the track into the drywall opening. Note: For single fixture run, attach the end cap to both ends.

Step 6 - Secure Track In Place

Secure the track with the screws through the trim holes around. Make sure the track is secured.

Step 7 - Connect Next Element

If needed, connect all consecutive elements of the track with 3 pin connectors located on each component. Secure into place by following step 6 with the newly consecutive tracks. For multiple fixture runs, attach the end caps to the beginning and the end of your run.

Step 8 - Secure Connected Track Into Place

Secure the newly connected track with screws through the trip holes around. Make sure the track is secured. Continue Step 7 and 8 for any continuing tracks.

Step 9 - Patch Plaster

Using painter's tape, cover the track slot. Add plaster on the track trim and smoothly patch it with a compound knife. Even the patched drywall surface out. Let it dry 12 hours minimum.

Step 10 - Finishing

Sand, the patched area, make sure to sand along the taped edge area for a smooth transition.

Step 11 - Luminaire Placement

Snap-in place desirable luminaires and enjoy the installation.
